

Number Guessing Game

We will need a random number

- We now know almost enough to create a number guessing game
- But we will need a way to generate random numbers
- We will need to import a module
- Imported modules are a useful feature of Python
- The “random” module is one of the built in modules that ship with Python’s Standard Library
- I have included an example in random_number.py

Now we can get started

- Create a new file named `guessing_game.py`
- This can be done outside of Codespaces in your own repository using the “add file” button or using the new file icon in the explorer inside Codespaces
- We will start by importing `random` and creating a variable to store the secret number we want to guess
- We will also need a variable for the player’s guess
- We will use `input()` to get a guess from the player
- We want the player to have a chance to guess over and over until they get it right

Repeated guesses

- We will need to use a while loop
- Which comparison operator will we use?
- What goes inside the loop?

Output to the player

- We should have a congratulatory message after the loop
- We could also have some messages telling the player whether they guessed too high or too low
- Where should these messages go?

Create an option to play again

- We will need to get input from the user on whether they want to play again or not
- If they say that they do want to, how do we do this?

Are there any errors?

- When you make multiple changes to a program, it is very easy to introduce errors
- Make sure to check for bugs often
